

**a** Maximum BONE load,  $R_{\max}$  (k $\Omega$ ), at a  $\pm 1.5\%$  budget

$n = 12,369$  simulated operating points from 12 LTspice runs (deterministic transient simulation; no stochastic replicates, so no error bars). Each PASS/FAIL boundary was refined until the window was  $1\ \Omega$ , far below marker size. Criterion  $|\text{IERR}| \leq 1.5\%$ .
